

Assignment – 4

Team ID	PNT2022TMID27467
Project Name	Newspaper Tracker Application
Team Member	Jesinthan

Question-1:

Pull an Image from docker hub and run it in docker playground.

Solution:

- Pull an image *uifd/ui-for-docker* from the docker hub
- This image is used for viewing and managing the docker engine
- Use `docker pull image_name` and `docker run -it image_name` commands to
- Run the above image in the Docker Playground

The screenshot shows the Docker Playground interface. At the top, there's a timer at 03:57:32 and a 'CLOSE SESSION' button. Below this is a sidebar with 'Instances' and a '+ ADD NEW INSTANCE' button. The main area displays the container's IP (192.168.0.8), memory usage (1.24%), CPU usage (0.31%), and an SSH command. A terminal window at the bottom shows the execution of 'docker pull hello-world' and 'docker run hello-world' commands, resulting in a successful pull and execution of the hello-world application.

Question-2:

Create a docker file for the job portal application and deploy it in Docker desktop application.

Solution:

- Create a docker file for build and deploy flask app.
- Use `docker build -t image_name`. In the current directory to start building the
- docker image and deploy in our local docker
- Use `docker run -p 5000:5000 image_name` to run in local system

CODE

FROM ubuntu/apache2

FROM python

COPY ./requirements.txt /flaskApp/requirements.txt

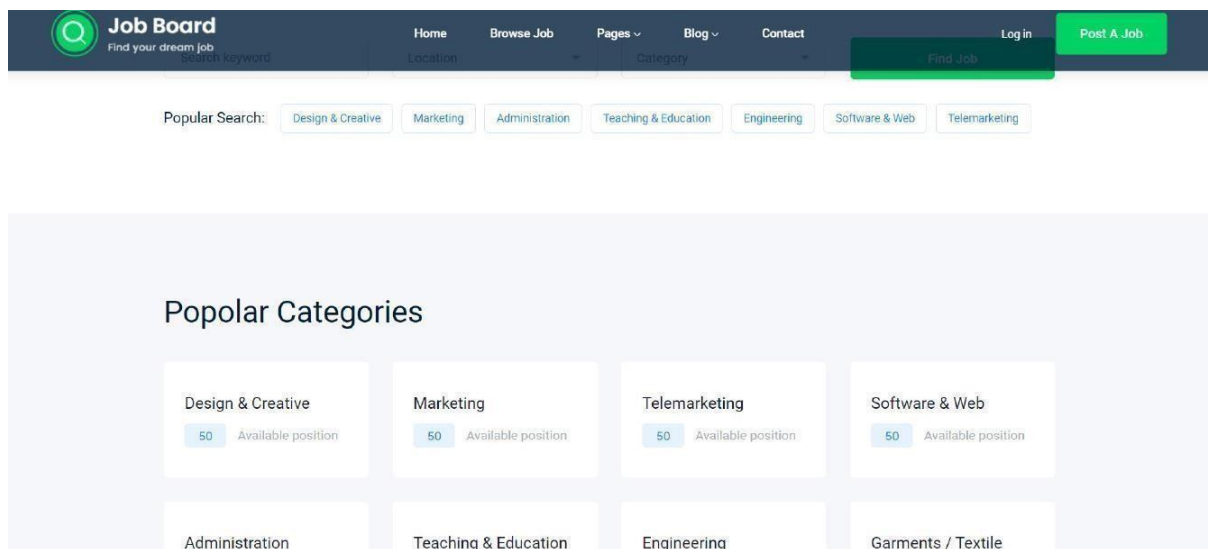

WORKDIR /flaskApp

RUN pip install -r requirements.txt

COPY . /flaskApp

ENTRYPOINT ["python"]

CMD ["app.py"]

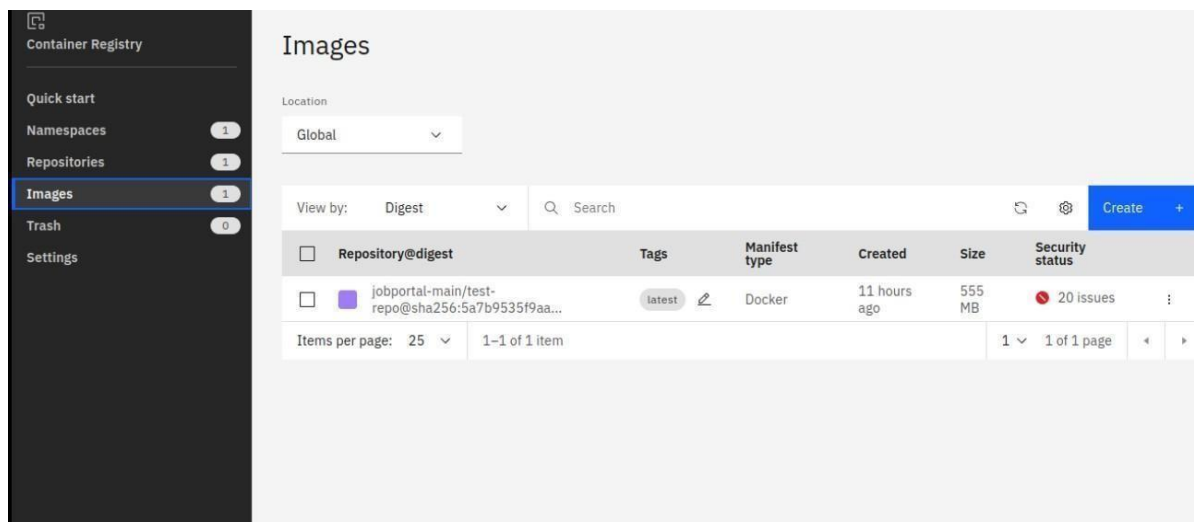

Question-3:

Create a IBM container registry and deploy hello world app or job portal app.

Solution:

- Log into IBM cloud
- Create a container registry
- Using IBM Cloud CLI, install the container registry plugin in our system
- Push our docker image into the created container registry using docker push. So, our job portal app is deployed in the IBM container registry

OUTPUT:

“HELLO WORLD”

Question-4:

Create a Kubernetes cluster in IBM cloud and deploy hello world image or job portal image and also expose the same app to run in node port.

Solution:

- Log into IBM cloud
- Create a kubernetes
- Using IBM Cloud CLI, install the ks plugin in our system
- Create a cluster in the kubernetes
- Now, go to the kubernetes dashboard where we need to create a service based on a
 - yml file (given below)
- In that file, we have to mention *which image we are going to use* and the *app name*
- Take the public IP address and Nodeport since we exposed the *flask app in nodeport*
- Finally, we got the url address where our flask app is hosted

CODE:

```
apiVersion: v1
kind: Service
metadata: name:
job-portal-app
spec: selector:
app:
job-portal-app
